

2017: America Grows More **#EnergyStrong**

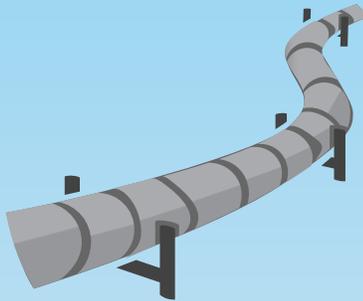

The first year of the Trump Administration marked both a continuation of many industry trends that have led America to become the world's energy superpower, and a strengthening of the foundation that will foster even greater growth. Private investment and technology advances continue to drive increases in energy production, while the Administration has begun to make good on its promises to provide regulatory relief and invest in infrastructure. Here are some highlights:

Energy Production Continues to Soar

Thanks to new technologies and private investment, U.S. crude oil and natural gas production volumes are reaching all-time highs.

Greenlighting Critical Infrastructure

After long delays by the previous administration, both the Keystone XL Pipeline and the Dakota Access Pipeline were approved.

A More Sensible Approach to Power Plant Regulations

EPA is rescinding the expensive and legally dubious Clean Power Plan, and has started a new process to formulate better regulations.

A Reliable Energy System

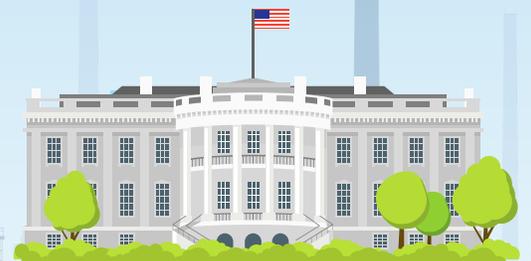

Despite devastating hurricanes, arctic weather and global turmoil, U.S. energy prices remain low thanks to our diverse, abundant mix of resources

More Opportunities for Energy Development

After decades of discussion, Congress permitted new development in a small area of Alaska. The Trump Administration has also announced a new draft offshore energy plan that is more expansive.

Delivering on Regulatory Relief

The new Administration is taking a critical look at onerous regulations, repealing some and reworking others. Combined with comprehensive tax reform, this will unleash capital investment and spur economic growth and higher wages.
